

## PWA EXP No 08

**Aim :** To create and register a service worker, and complete the install and activate process for a new service worker for the E-commerce PWA

### Theory :

Service worker is a script that works on browser background without user interaction independently. Also it resembles a proxy that works on the user side. With this script you can track network traffic of the Manage push notification and develop 'offline first' web application with cache API

### Service worker cycle

A service worker goes through three steps in the lifecycle

- Registration
- Installation
- Activation

what can we do with Service workers?

- you can dominate Network Traffic
- you can cache
- you can Manage Push Notification
- you can continue
- what can't we do ~~this~~ with Service workers

Ans: you can't access the window  
you can't work it on so port

Activation: The activate event ensures that old ones are cleaned up with a new version of the Service worker is installed

caching strategy: The Service worker uses a caching strategy (such as cache first or network-first) to decide how to serve resources to users when they're offline

conclusion:- In conclusion the process of coding registering a Service worker for my fundraising webapp involves several important steps to ensure your app function offline and delivers enhanced performances.

### Steps to Make Your Vite React App a PWA

#### 1 Register the Service Worker

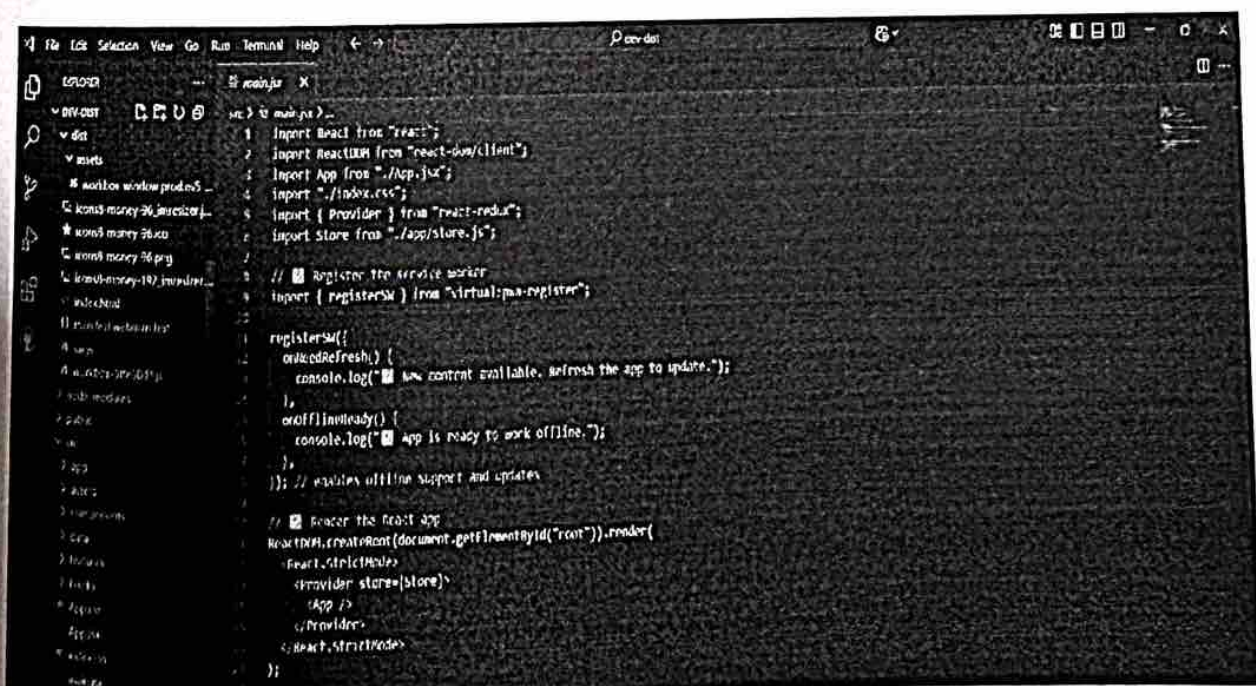

1. Open `main.jsx` (or wherever React renders the app).
2. Import the `registerSW` function from `virtual:pwa-register`.
3. Call `registerSW()` to activate the service worker.
4. This ensures that the app works offline and updates correctly.

#### 2 Verify PWA Installation

1. Start the Vite development server.
2. Open Chrome DevTools (F12) → Go to Application → Manifest.
3. Check if the Install button appears in the address bar.
4. Install the app and check if it works like a standalone application.

#### 3 Test Service Worker Activation

1. Open Chrome DevTools → Application → Service Workers.
2. Check if the service worker is registered.
3. Enable Offline mode and refresh the page to test caching.
4. If the app loads, the service worker is working successfully!

```
1 import React from "react";
2 import ReactDOM from "react-dom/client";
3 import App from "./App.jsx";
4 import "./index.css";
5 import { Provider } from "react-redux";
6 import Store from "./app/store.js";
7
8 // Register the service worker
9 import { registerSW } from "virtual:pwa-register";
10
11 registerSW({
12   onNeedRefresh: () {
13     console.log("New content available. Refresh the app to update.");
14   },
15   onOfflineReady: () {
16     console.log("App is ready to work offline.");
17   },
18 }); // enables offline support and updates
19
20 // Render the React app
21 ReactDOM.createRoot(document.getElementById("root")).render(
22   <React.StrictMode>
23     <Provider store={Store}>
24       <App />
25     </Provider>
26   </React.StrictMode>
27 );
```

dev-dist

JS registerSW.js

JS sw.js

JS workbox-417a7bf.js
